

Selection of Date

This use case enables the customer actor to select a movie date. If the movie date is defined as available, then movie posters for that date are displayed with the help of the external API actor. If the movie date is not defined as available, an error message is displayed.

Alternate Flow: An alternate flow would be that the administrator could change the availability of movies for certain dates at any time, meaning that the displayed event (error message/movie posters) for the user could change.

Exception Flow: The exception flow would occur when the user selects a date with no available movies, as it would prevent them from achieving their goal which is to select a movie to watch.
