

Check Signup Input

This use case enables the user (new or existing) to login or sign up to the system. A new user must first sign up with the system and then login. Their username and password must be validated with the help of the database actor. It must not already exist within the database. When an existing user logs in, their username and password must be validated. It must match with the user details in the database.

Alternate Flow: An alternate flow would be that the user logs in but they don't end up booking tickets, or that a user signs up but decides not to login.

Exception Flow: The exception flow would occur when the user enters an incorrect/invalid username or password.

Information

Rank	Low
ID	
Status	Unspecified
Justification	
Primary Actors	Existing User, New User
Supporting Actors	Database

Details

Level	Interface
Complexity	Low
Use Case Status	Initial
Implementation Status	Scheduled
Preconditions	A precondition is that the user has an email address which they will be using to login/signup.
Post-conditions	The post condition would be that the user would be redirected to the seat booking/movie selection page.
Author	N/A
Assumptions	An assumption is that the user intends to book tickets for a movie, which is why they are logging in/signing up with the system.
